1. Application navigation.
    a. Start at a login page, once a user is in, show the main page, which displays their saved / recently searched reviews. Users can interact with the saved / recent ones as a shortcut to ask more questions regarding that same one. They may also search for new locations using a search bar on the main page
2. Page layout.
    a. The header can take the user to different pages, the search bar will be in the focus of the page, after a review is prompted, information regarding it is displayed on the bottom which the user can scroll through, and then at the very bottom is where they can ask the LLM plain english questions about the information
3. Form conventions.
    a. Page should look neat and well organized, well labeled so users understand the functions of everything
4. Validation and error presentation.
    a. When requests are validated they should simply do as they were intended, and when that request is not immediately visible to the user, a success notification should pop up, but in case of errors the user will receive an error message describing to the best of the coders ability what went wrong when possible
5. Loading and processing states.
    a. Notify the user with a simple please wait / processing pop up informing them that the request is in progress.
6. Button and action conventions.
    a. Use simple colors for buttons, and ones that follow standard user knowledge that the average user will understand
7. Spacing and typography.
    a. Use consistent fonts and font sizes, as well as using standard margins between blocks of text or images
8. Reusable component expectations.
    a. Make it easy to repurpose components in the future in case things are needed to be added.
